EURACT NMR  
KARLSRUHE 2010

- Analogues having the capability of mimicking the transition state of enzymatic amide formation or hydrolysis.
- They could therefore act as enzymatic inhibitors.
- This potential activity drives us to find some structural diversity.
- And interestingly, phosphoramidate reactivity could be selectively tuned depending on the conditions assayed.

Multinuclear NMR  
X/Y Shift Correlation

# Multinuclear NMR: X/Y Shift Correlation Methods

The sensitivity of any heteronuclear NMR experiment is related to  $\gamma$  of starting and detected nuclei, among others parameters

$$S / N \propto \gamma_{start} \gamma_{detect}^{3/2} [1 - \exp\{-1/T_{1,start} \times D1\}] \times NS$$

Indirect measurements =  $\gamma^{5/2}$

Polarization transfer =  $\gamma_{start} \times (\gamma_{detect})^{3/2}$

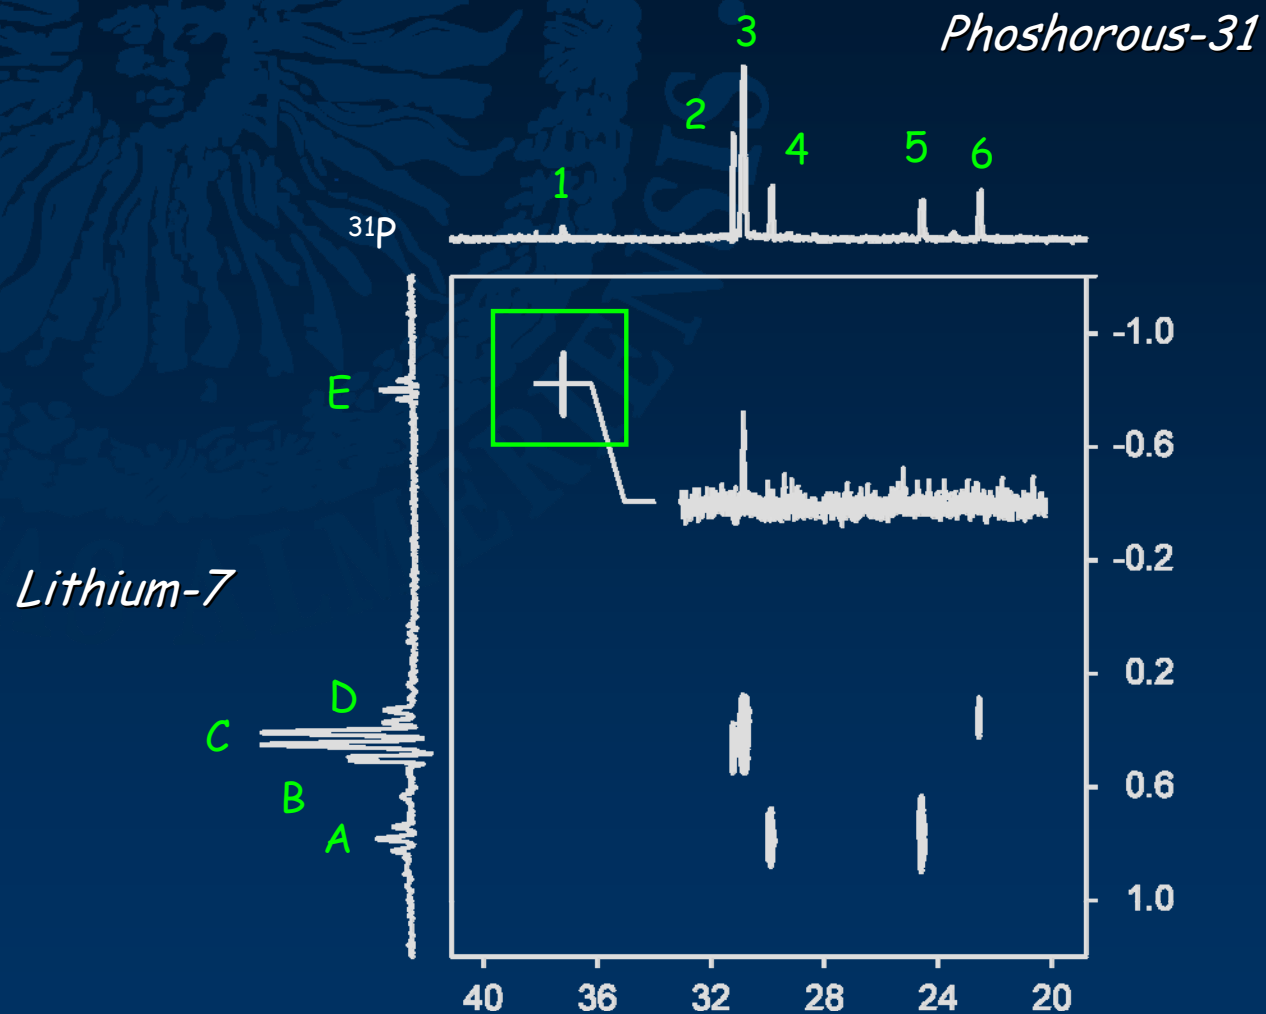

In lithiated phosphinamides systems, we wanted to setup the  ${}^7\text{Li}({}^{31}\text{P})/{}^{31}\text{P}({}^7\text{Li})$  Shift correlation experiment.

$(R_c(\text{P-31})/R_c(\text{Li-7})) \sim 2.5$

$\text{Li-7 } (I=3/2) / \text{P-31 } (I=1/2)$

Phosphinamide Linkage – A Multinuclear NMR Touch*

**Ignacio Fernández**

*Universidad de Almería (Spain)*

EURACT NMR  
KARLSRUHE 2010

# Convection: A quite familiar problem on RLi diffusion

Convection introduces a cosine modulation on signal attenuation. The resulting effect is governed by

$$I(2\tau)/I_0 \propto \cos(\gamma G \delta v \Delta) \exp - [(\gamma G \delta)^2 D (\Delta - \delta/3)]$$

Flow rate

In laminar flow conditions where  $(u^2 \times D) \ll D$  and  $d \ll D$  (most common case), the apparent diffusion coefficient appears

$$D_{app} = D + \frac{v^2 \Delta}{2}$$

Wrong D values

Langmuir 2000, 16, 7548.

Helv. Chim. Acta 2003, 86, 2364.

# Convection: A quite familiar problem on RLi measurements

- 2) Spinning
- 3) Concentric tubes

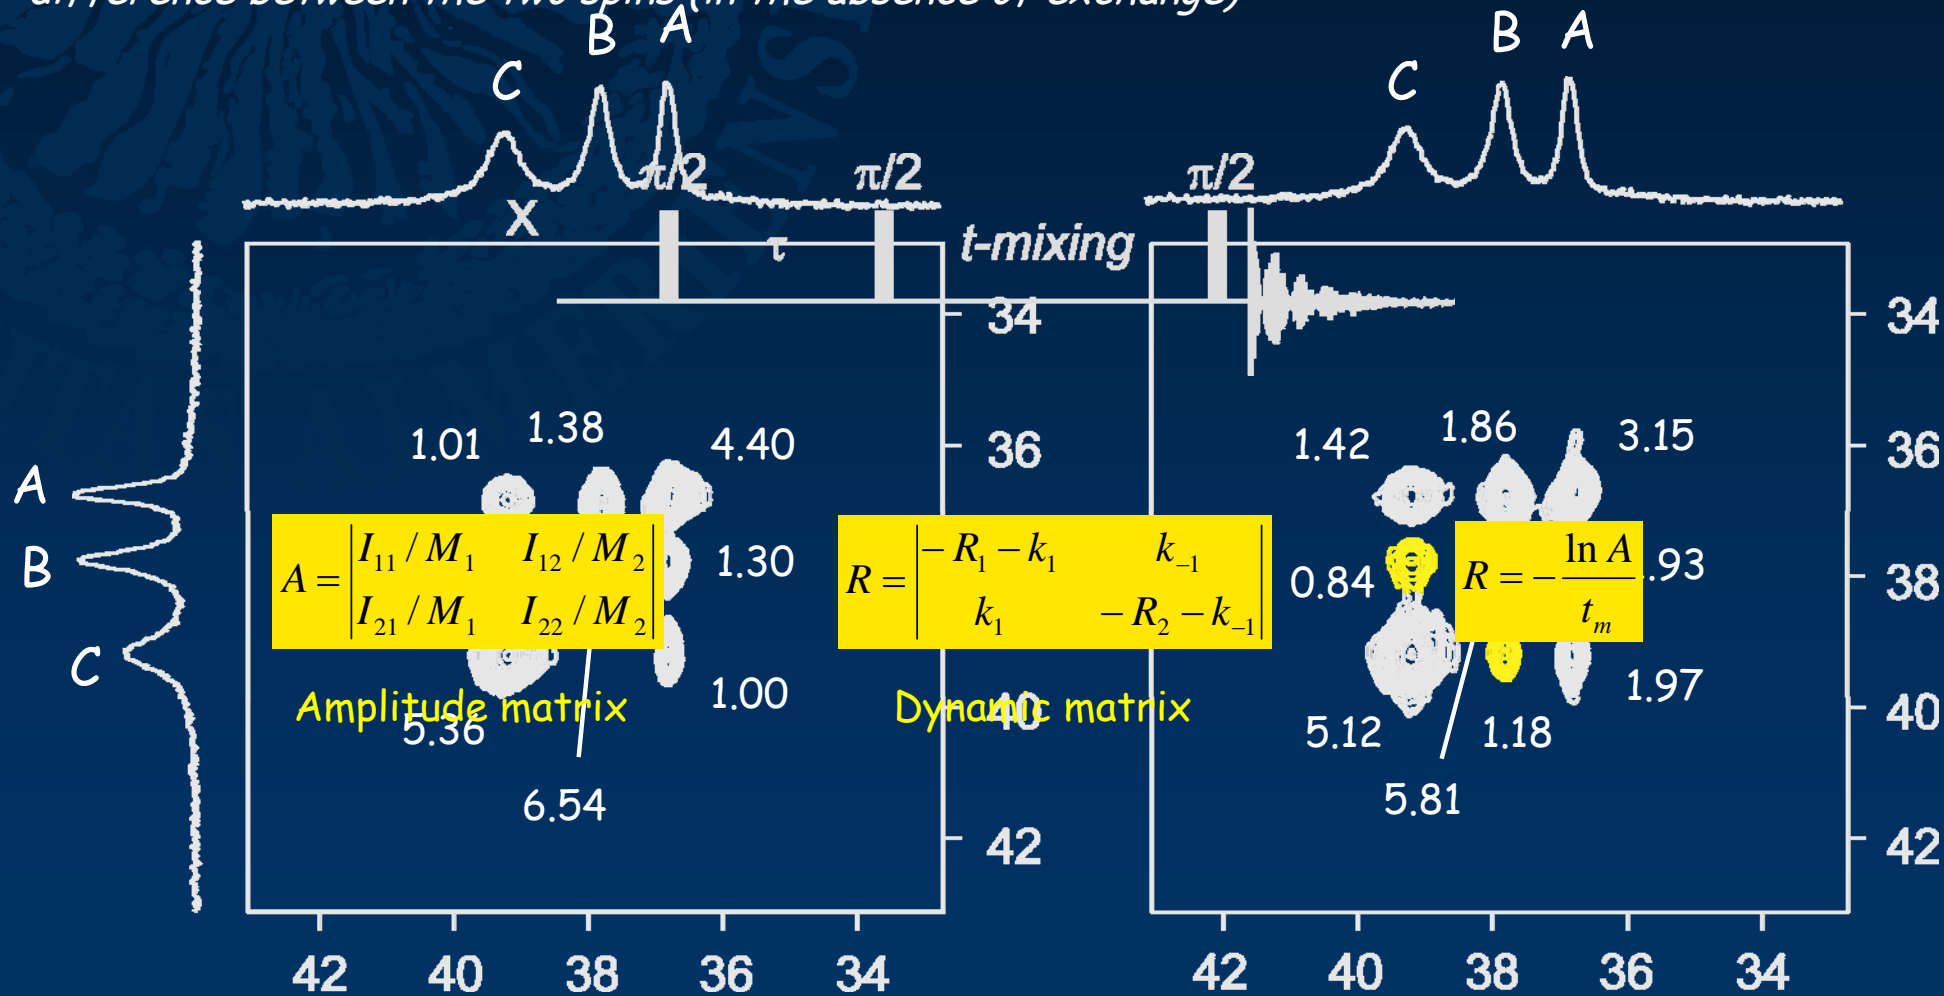

$$D_{app} = D + \frac{v^2 \Delta}{2}$$

# $^{31}\text{P}$ , $^{31}\text{P}$ EXSY NMR, $-80^\circ\text{C}$ , $0.057\text{ M}$ , $\text{THF-}d_8$

The 2D EXSY technique provides off-diagonal responses for spins which exchange slowly with one another. The EXSY method is useful for showing exchange when the rate of the exchange is greater than or of the same order as the  $T_1$  relaxation rate ( $1/T_1$ ) but less than the frequency difference between the two spins (in the absence of exchange)
